At Assent, we are acutely aware of your focus on speed and technology. Our automated trading program offers a solution with lightning fast execution supported by a rich technological infrastructure. We have optimized our trading platform to meet the unique needs of automated traders.

### **Speed: Lightning Fast Execution and Settlement Processes**

Assent's automated trading platform offers lightning fast execution that has been optimized for the needs of automated trading. Our Master Transaction Servers are dual quad DELL 2950 machines, capable of processing over 1,400 orders per second with under .9 milliseconds latency.

Additionally, as a self-clearing broker-dealer, automated traders can utilize our self-clearing and settlement processes, reducing information transmission latency and maximizing efficiency.

### **Reliability: Consistent Investment in Our Technology Infrastructure**

Our technology infrastructure is consistently upgraded to meet the robust needs of automated traders. Our system currently processes several million trades per day, with the potential scalability to trade up to the physical constraints of your trading strategy.

### **Anonymity**

As a broker-dealer with existent connectivity to all major exchanges and many dark pools, we offer traders anonymity in the execution of their automated strategies.

### **Risk Management**

Our platform for automated trading offers a robust and customizable risk management tool that helps manage your trading strategies. Additionally, our self-clearing and settlement processes reduce information transmission, adding efficiency to your system.

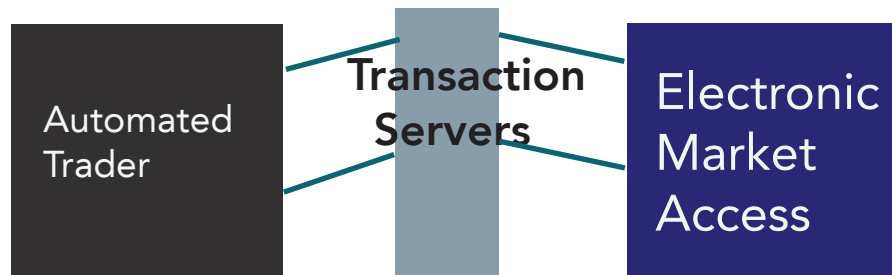

ASSENT

Our system has supported 35 million transactions per Master Transaction Server with potential scalability to meet the needs of your automated strategies.

Leave Em'  
In the Dust:

Assent  
Automated  
Trading

Less than .9 milliseconds latency

### Black Box and Grey Box Trading

Assent offers a range of customized solutions for traders utilizing "black box" or "grey box" strategies. We understand your need for a platform that reduces latency and maximizes your execution. Our platform can be optimized to support fully automated "black box" as well as partially automated "grey box" strategies. Additionally, we offer hosting services in our New York and Hoboken data centers.

### The ANVIL API

Assent's ANVIL API is a set of C++ functions and classes that can be programmed to support your proprietary trading strategies. The API is encapsulated in a dynamic linked library that connects to our infrastructure. ANVIL API gives program traders access to our lightning fast ANVIL trading platform without the need for their own dedicated server or the higher overhead costs of maintaining a FIX based system.
